

Automating Your Equipment

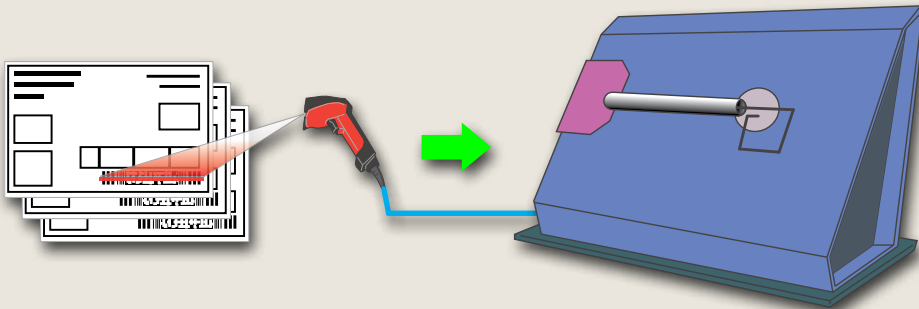

TABLE BENDERS • DOUBLE BENDERS • OFF-COIL MACHINES • SHEARLINES

aSa TouchTracker connection

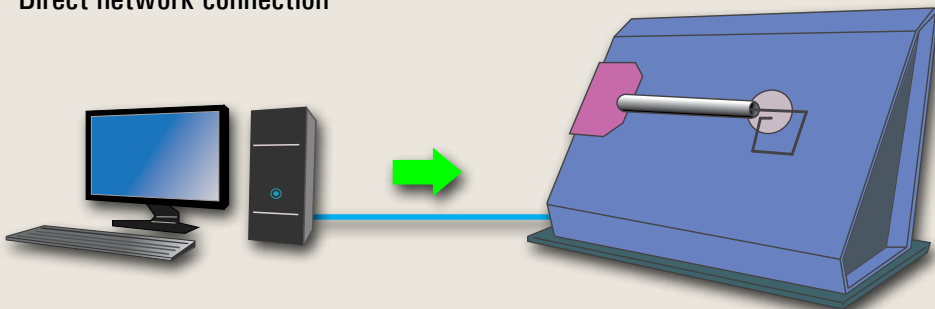

The aSa TouchTracker is a powerful scanner-equipped tracking unit that communicates with your network via a wired or wireless connection. When a TouchTracker is connected to a piece of fabricating machinery, you can relieve inventory, track fabrication, and automate cutting or bending with a single scanner. Tethered scanners and wireless Bluetooth units can be used with the aSa TouchTracker.

Direct scanner connection

Most newer fabrication machines can be equipped with hand scanners. aSa Production software generates barcoded tags. The barcodes contain all the instructions needed to produce the item. To fabricate, simply scan the tag's barcode.

Direct network connection

Some types of rebar machinery connect directly to your network. The equipment's console can access aSa-generated fabrication instructions directly from a network drive.
